

---

## Name

passwdmanrli — Rogue-like user interface for passwdman

## KEYS

- "WASD", "HJKL", "8462" and up, left, down, right.
- Space or enter to select.
- Escape to quit.

Text-writing sucks.

## The change meta-data and update button

- If the password was created with the "Add existing" button: use the "change meta-data & update" button.
- If the password was created with the "Create new" button: use the "update" button.
- If the minimal required length for the password or the maximal allowed length or the allowable characters have changed: use the "change meta-data & update" button.

## Difference between Add existing and Create new

Click on those buttons and see what happens. They are not dangerous.

## Undo Redo

The "Undo" and "Redo" buttons undoes/redoes the LATEST change in the password tab or the fake-password tab, independent of which tab you're currently in.

## fake-passwords/honey pots

The fake-passwords/honey pots are intended to be used as traps to catch crackers. The "pick" buttons picks a random fake-password, independent of what you have selected. You should add fake-passwords such as "password" and "drowssap".

## BUGS

- Very little testing.
- `edit_line()` sucks!
