Name

~/.passwdman/passwords, ~/.passwdman/honeypots, ~/.passwdman/undoable/, ~/.passwdman/redoable/, ~/.passwdman/gui.conf — data-files for passwdman.

~/.passwdman/passwords

The password list. It is an XML file, you are expected to understand an example of the file.

```
<?xml version='1.0' encoding='UTF-8'?>
<root magic="passwdman" file="passwords" version="0.1">
    <!--The attribute 'magic' may not be changed.
    The major version may not be greater than zero.
    The attribute 'file' is used to make sure that it is the right file.-->
    <passwd name="What the password is for" value="top_secret"/>
    <passwd name="TEST" value="0123456789">
        <!--A 'passwd'-element is allowed to contain a 'meta'-element.-->
        <meta type="10" minlength="4" maxlength="255"/>
        <!--type == "human":
                Human generated password.
            type == "10":
                Digits only.
            type == "64":
                Digits, big letters, small letters, underscores and
                exclamation marks.
            'minlength' is the minimal length required for the password.
            'maxlength' is the maximal length allowed for the password.

            The meta-data is used when updating the password.-->
    </passwd>
</root>
```

~/.passwdman/honeypots

The list of honeypots. The honeypots are fake-passwords, to help catching crackers. This too is a XML file.

```
<?xml version='1.0' encoding='UTF-8'?>
<root file="honeypots" magic="passwdman" version="0.1">
    <!--look at ~/.passwdman/passwords-->
    <honeypot value="BadPassword"/>
    <honeypot value="putme_injail_ifi_typethis"/>
</root>
```

~/.passwdman/undoable

Backups. The undo() function looks for the newest file and doesn't care about the filename. If "passwords" is in the filename, the file is a backup of `~/.passwdman/passwords`. If "honeypots" is in the filename, the file is a backups of `~/.passwdman/honeypots`. It copies the current state to `~/.passwdman/redoable` before it restores from the backup.

~/.passwdman/redoable

The opposite of `~/.passwdman/undoable`. The function is redo().

~/.passwdman/gui.conf

The GUI configuration file:

```
#Configuration file for passwdmangui.
#If there is any number-sign in a line, the line is a comment.
This is a comment. #
#It knows about 'show_passwd', 'true' and 'false'.
 #It is case sensitive.
show_passwd false
```
